At the Forefront of Research

PHYSICS OF HIGH- T_c SUPERCONDUCTORS

J.C. Phillips

From the Preface:

"Condensed matter chemists and physicists have written thousands of research papers in less than two years on the subject of high-temperature superconductivity, and the literature has become as forbidding as the darkest jungle. The aim of this book is to cut a well-marked path through this jungle, not by listing every paper, but rather by highlighting what I judge to be the important experiments. To understand these experiments one also needs a few simple ideas, and I have mentioned these where necessary."

This is the first book to provide a unified discussion of all aspects of this subject from a single point of view based on the traditional BCS theory. Readers familiar with the author's previous book, **Bonds and Bands in Semiconductors** (Academic Press, 1973), will recognize the same emphasis on fundamentals and general relations in his discussion of this exciting new field.

CONTENTS: Old Materials. Old Theory. New Materials. New Theory. Isotope Effect. Lattice Vibrations. Optical Spectra. Tunneling. Relaxation Studies. Materials Morphology. Bismates and Thallates. Appendix A: Macroscopic Parametric Relations. Appendix B: Microscopic Theory. Appendix C: Crystal Chemistry.

SOLID STATE PHYSICS Advances in Research and Applications

Volume 42

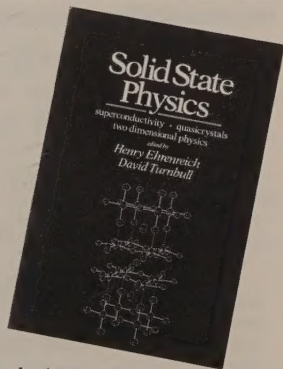

edited by

Henry Ehrenreich and David Turnbull

This volume deals with three topics at the forefront of interest in solid state physics: (1) Condensed matter having polytetrahedral order; important examples include liquids, crystals, glasses, Frank-Kasper phases and quasi-crystals; (2) Aspects of high-temperature superconductivity; and (3) The electronic behavior of two dimensional systems, most notably the integral and fractional quantum Hall effects. Each chapter is copiously referenced and designed to be as comprehensive and accessible as possible. Much of this material will ultimately find its way into standard solid state textbooks, and, indeed, may be regarded as a complement to those books that are presently available.

CONTENTS: D.R. Nelson and F. Spaepen, Polytetrahedral Order in Condensed Matter. M. Tinkham and C.J. Lobb, Physical Properties of the New Superconductors. R. Beyers and T. Shaw, Structure of $YBa_2Cu_3O_{7-x}$ and its Derivatives. K.C. Hass, Electronic Structure of Copper-Oxide Superconductors. A. Ishihara, Electron Correlations in Two Dimensions. Each chapter includes references. Index.

In Paperback: \$29.95/ISBN: 0-12-607790-8
Casebound: \$69.50/ISBN: 0-12-607742-8

Journal of Differential Equations

Editor-in-Chief

Jack K. Hale

Georgia Institute of Technology, Atlanta

This journal is concerned with the theory and the application of differential equations. The **Journal of Differential Equations** publishes articles addressed not only to mathematicians, but also to those engineers, physicists, and other scientists for whom differential equations are valuable research tools.

Research Areas Include

- Mathematical control theory
- Ordinary differential equations
- Partial differential equations
- Related topics
- Stochastic differential equations
- Topological dynamics

Buildings, Deviations, Monsters...

LECTURES ON BUILDINGS

Mark Ronan

The theory of buildings was developed, mainly by Jacques Tits in the 1950s, in an attempt to develop a systematic interpretation of semi-simple Lie groups, particularly the exceptional groups. This book presents an up-to-date account of this theory, including the new developments such as the chamber systems (introduced by Tits in the 1980s). The book starts from basic principles and later deals with important classes of buildings, particularly those of spherical and affine type. Special topics, including two tables on finite buildings and groups, are included in six appendixes.

ADVANCED TOPICS IN THE THEORY OF DYNAMICAL SYSTEMS

edited by
G. Fusco, M. Iannelli,
and L. Salvadori

These proceedings cover new research on a wide range of topics in the theory of dynamical systems, including both theoretical aspects and problems arising from applications. A number of articles are devoted to finite dimensional systems, with special emphasis on the analysis of existence of periodic solutions to Hamiltonian systems. Others deal with infinite dimensional systems and are concerned with recently developed methods in the general approach to existence and qualitative analysis problems as well as with the study of particular systems arising in the natural sciences.

April 1989, c. 280 pages, \$29.95
ISBN: 0-12-269990-4

LARGE DEVIATIONS

Jean-Dominique Deuschel
and Daniel W. Stroock

This book provides a survey of the modern mathematical theory of large deviations. Starting from two classical examples, Cramer's Theorem concerning independent R-random variables and Schilder's Theorem for rescaled Wiener measures, the authors develop general principles. Written for a non-specialist audience, the book can be used as the basis for a graduate course on the subject and will bring the reader up to the current level of research.

May 1989, 322 pages, \$34.95

NUMBER THEORY, TRACE FORMULAS AND DISCRETE GROUPS

Symposium in Honor of
Atle Selberg, Oslo,
Norway, July 14-21, 1987
edited by

Karl Egil Aubert, Enrico
Bombieri, and Dorian Goldfeld

One of the most powerful mathematicians of this century, Atle Selberg has almost single handedly changed the course of modern analytic number theory. This volume contains the proceedings of an international conference that was held in honor of his 70th birthday. The aim of the conference was to survey Selberg's principle contributions to mathematics in the areas of prime number theory and zeta functions, sieve methods, trace formulas and discrete groups, and also to focus on their most recent development.

\$69.95/ISBN: 0-12-067570-6

VERTEX OPERATOR ALGEBRAS AND THE MONSTER

I.B. Frenkel, J. Lepowsky,
and A. Meurman

This work is motivated by and develops connections between several branches of mathematics and physics—the theories of Lie algebras, finite groups and modular functions in mathematics, and string theory in physics. It presents a new mathematical theory of vertex operator algebras, the algebraic counterpart of two-dimensional holomorphic conformal quantum field theory. It also constructs the Monster finite simple group as the automorphism group of a very special vertex operator algebra, called the "moonshine module" because of its relevance to "monstrous moonshine."

March 1989, 560 pages, \$69.95
ISBN: 0-12-267065-5

INITIAL BOUNDARY VALUE PROBLEMS AND THE NAVIER-STOKES EQUATIONS

Heinz-Otto Kreiss
and Jens Lorenz

This book provides a systematic treatment of time dependent partial differential equations of parabolic, hyperbolic or mixed type. Written for graduate students and researchers in mathematics and engineering, the book covers the theory of an important class of evolutionary systems and provides background material for their numerical treatment. The Navier-Stokes equations of fluid dynamics—compressible and incompressible—serve as an important example to illustrate the results.

JOURNAL OF COMPLEXITY

Editor

J. F. Traub, *Columbia University, New York City*

The *Journal of Complexity* publishes original research papers that contain substantial mathematical results on complexity as broadly conceived. In the area of computational complexity, the journal focuses on problems that are approximately solved and for which optimal algorithms or lower-bound results are available. The *Journal of Complexity* publishes papers that provide major new algorithms or make important progress on upper bounds, and also addresses such complexity topics as physical limits of computation; chaotic behavior and strange attractors; and complexity in biological, physical, or artificial systems.

Research Areas Include Complexity Results in
